Shining a light on research & innovation.

## Water, Water Everywhere...For Now

Transcript of Voiceover Narration

All life on Earth depends on water; Canada has more than any other country on Earth, but the supply isn't endless, and the quality isn't guaranteed.

Access to water is a global issue.

Canadian university researchers are helping find cost effective solutions to clean unusable water. They're studying the interaction of water in the atmosphere; how soil contaminants upstream impact water quality downstream. Using powerful computer clusters, they're revealing how global climate change influences the environment in your community.

Clean water determines our future. That's why Canadian researchers are working to preserve our most important resource.

Come meet them!
